REVIEW

Book reviewed by Dr Daniel J Connolly, consultant radiologist, Sheffield Teaching Hospitals NHS Foundation Trust.

Pediatric Neuroimaging has been the standard reference text for radiologists reporting paediatric brain and spine imaging studies since the first edition was produced.

The latest (2018) sixth edition has been updated with new and better images, drawings and photographs. The tables have been redesigned from the fifth (2012) edition to a far more appealing format, facilitating review of the tables to allow the reader to find the descriptors or pathologies they may be searching for. The metabolic, toxic and autoimmune/inflammatory brain disorders chapter has been improved with new material to assist the reader in their review of a potential cause of a white matter disorder.

The previous emphasis on genetics has been slightly toned down making the text less daunting to most radiologists, while maintaining the editorial quality to allow the reader to gain significant knowledge of a pathology with the usual clarity of writing.

The book is now available to be read directly on your preferred devices, including computers, tablets and smartphones (iOS, Android, PC and Mac). This will assist the new generation of readers who prefer to carry a single device (often containing several downloaded e-books) from reporting room, to MDT, to office and then home. The book reads well on this reviewer's iPhone and Mac computers.

While no book is perfect, Pediatric Neuroimaging remains essential and is easily the best in its field. Any radiology reporting institution that reviews children's brain and spine MR imaging should have access to a copy and any radiologist in paediatric and/or neuroradiology training will require a copy beside them when they are at work and then at home to learn and revise.
